

# Active target data analysis

## The active target MAYA

# The active target MAYA

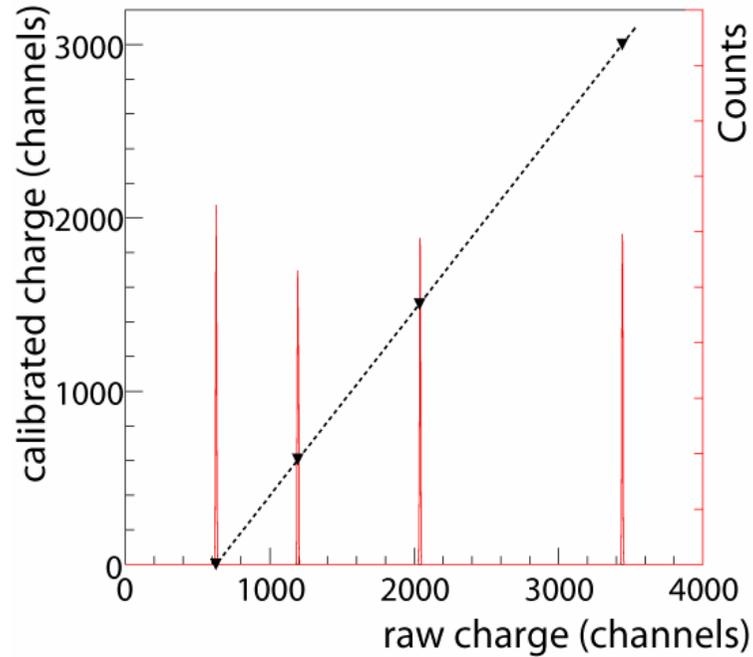

A two dimensional charge – one dimensional time projection chamber

Cathode recorded pattern  
 → 2 dimensions

Wire recorded time  
 → 3<sup>rd</sup> dimension

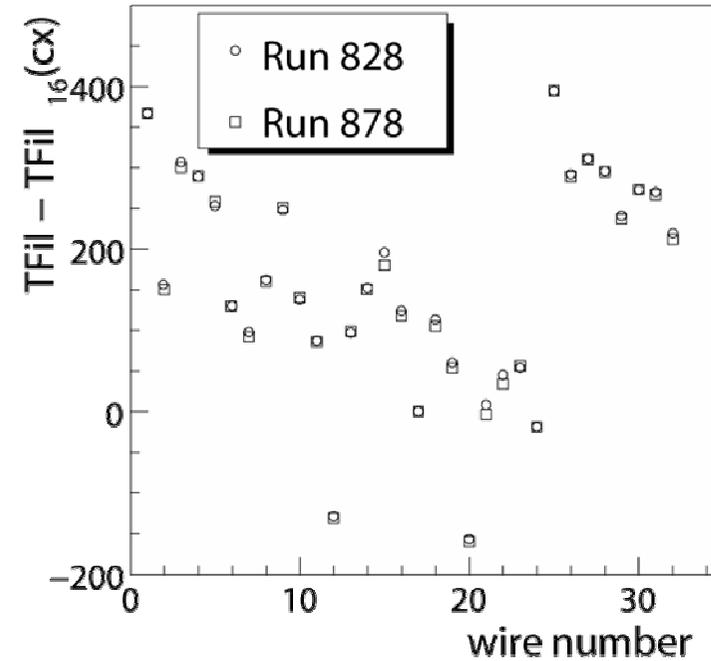

## PADS calibration with pulser

Dynamic : 90%

Resolution : < 0.5%

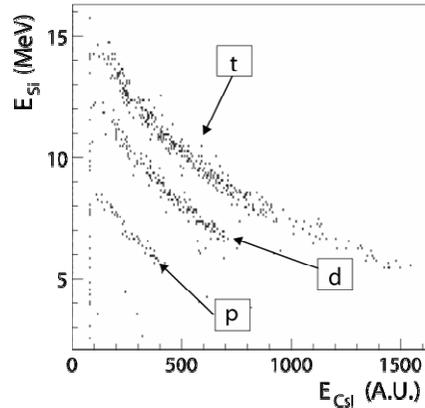

## Time calibration with pulser

Good stability

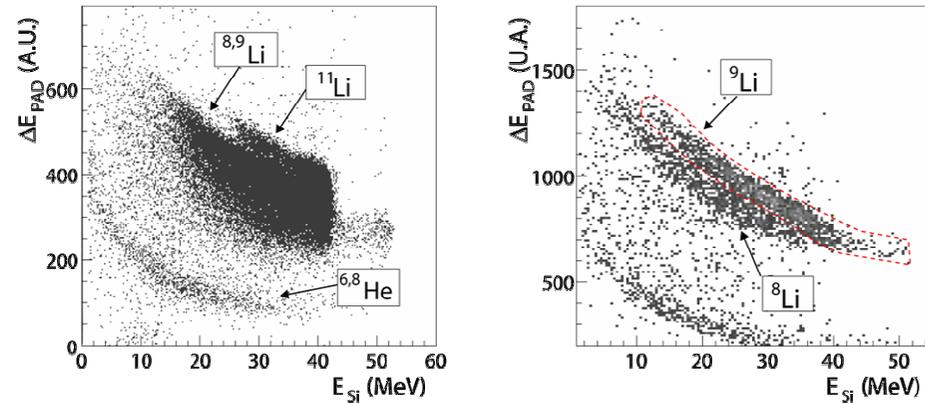

Resolution : < 5%

Light + high E → Si / CsI

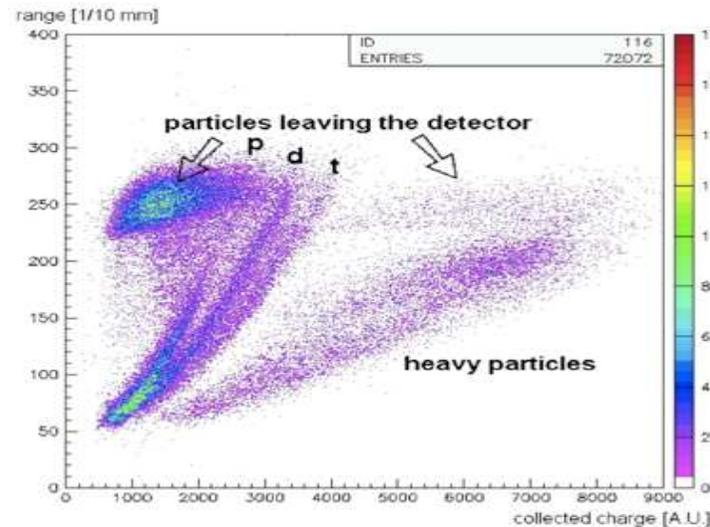

Good resolution  
 Calibration of CsI?

Medium E → PADS / Si

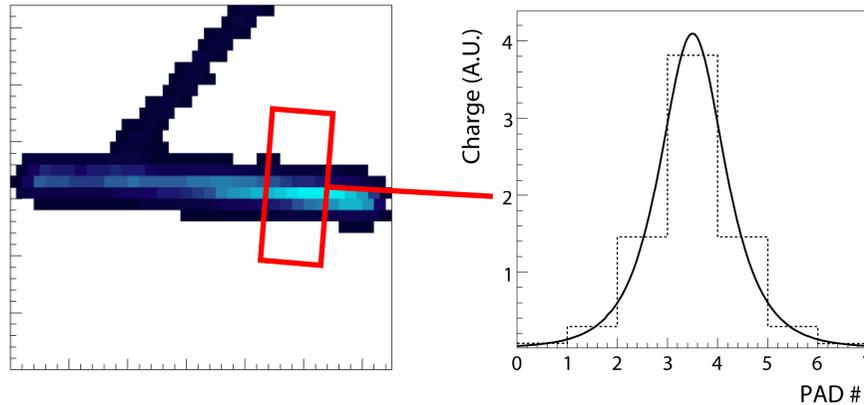

ΔE resolution - Dynamics ?  
 Absolute calibration of charge ?

Low E → Range / ΔE

Range resolution?  
 ΔE resolution - Dynamics ?

→ Distribution induced by a point source

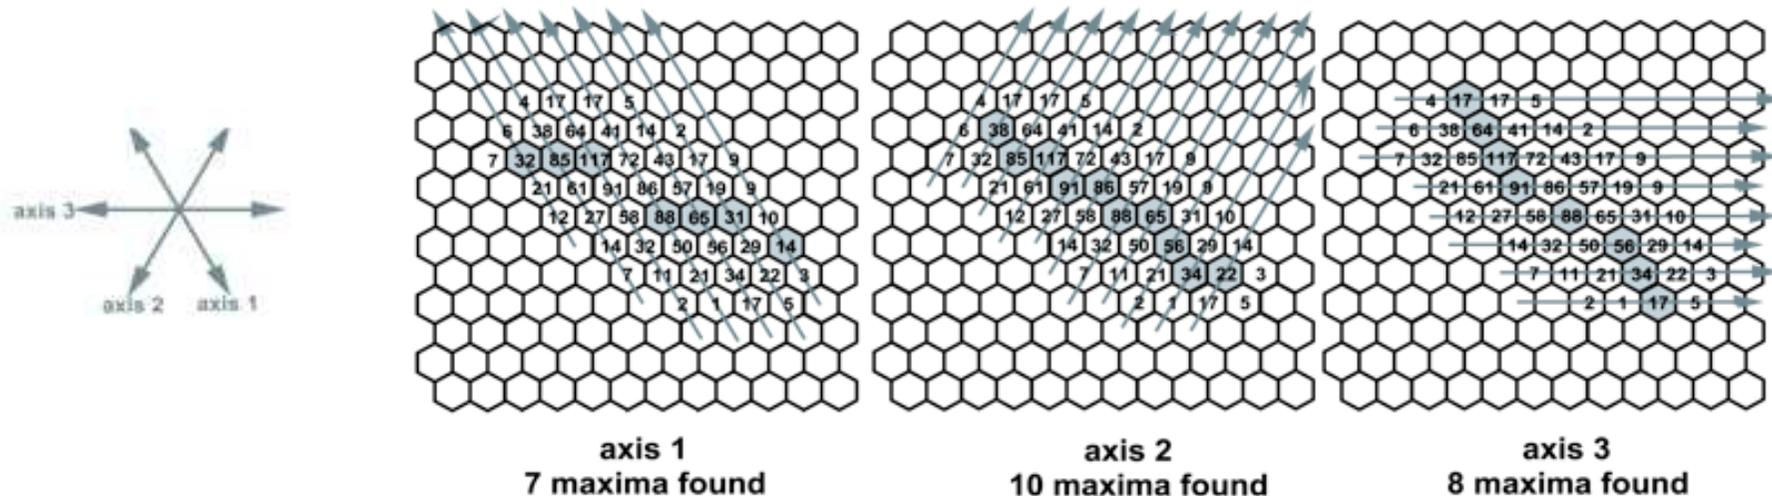

$$\sigma(x, y) = \frac{-Q}{2\pi} \sum_{n=0}^{\infty} \frac{(-1)^n (2n+1)L}{[(2n+1)^2 L^2 + x^2 + y^2]^{3/2}}$$

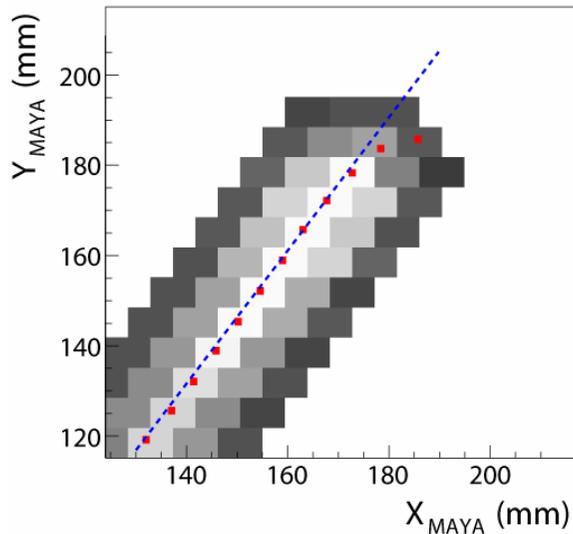

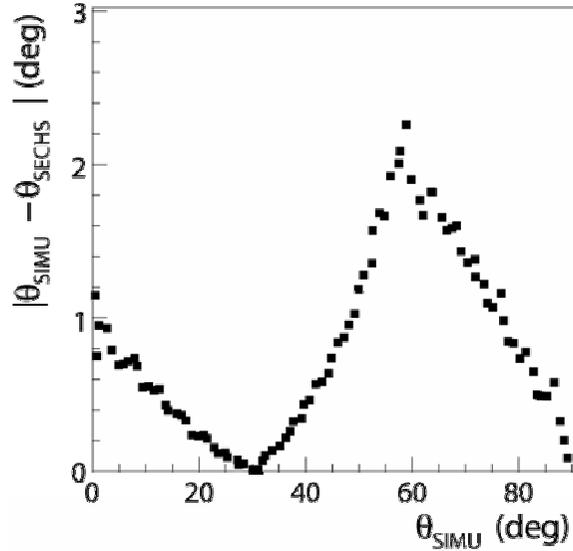

$$\Delta_R = \frac{w}{2} \frac{\ln\left(\frac{1+a_1}{1-a_1}\right)}{\ln(a_2 + \sqrt{a_2^2 - 1})}$$

$$a_1 = \frac{\sqrt{\frac{Q_0}{Q_+}} - \sqrt{\frac{Q_0}{Q_-}}}{2 \sinh a_2} \quad \text{and} \quad a_2 = \frac{1}{2} \left( \sqrt{\frac{Q_0}{Q_+}} + \sqrt{\frac{Q_0}{Q_-}} \right)$$

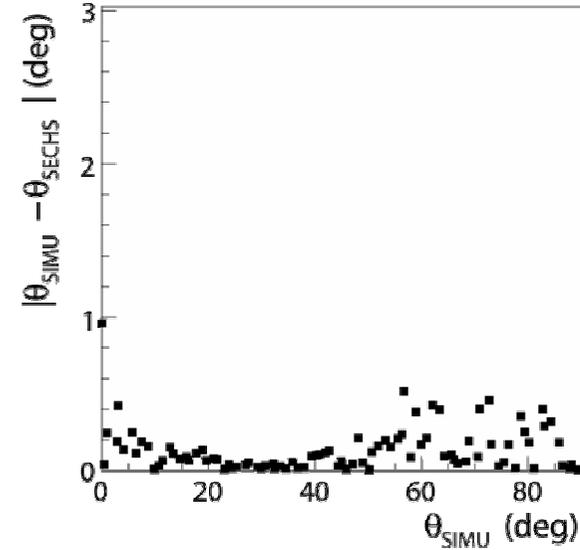

→ Search of the most perpendicular axis

Calculated angle  
 shifted around 0° and 60°

Effect disappear  
 when removing last points

Resolution  $< 0.5^\circ$

**BUT:**

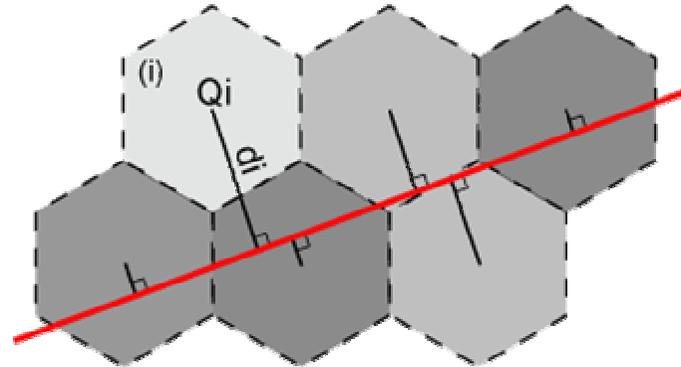

Range has to be  $> 4$  PADS!

Thickness of the track !

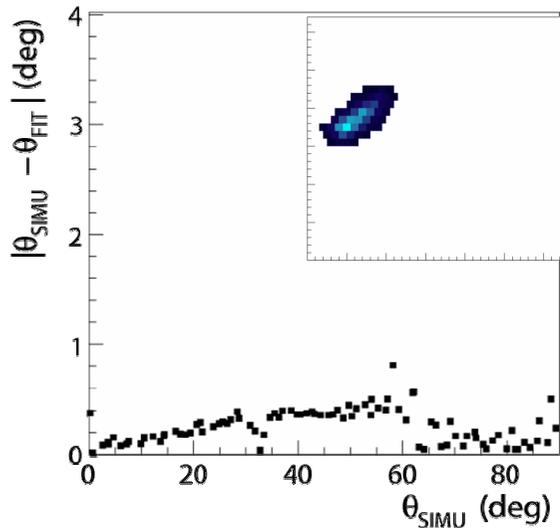

➔ PAD size could help

→ Orthogonal distance regression

$$\chi^2 = \sum_{n=0}^{N_{pts}} Q_n \frac{(ax_n + b - y_n)^2}{a^2 + 1}$$

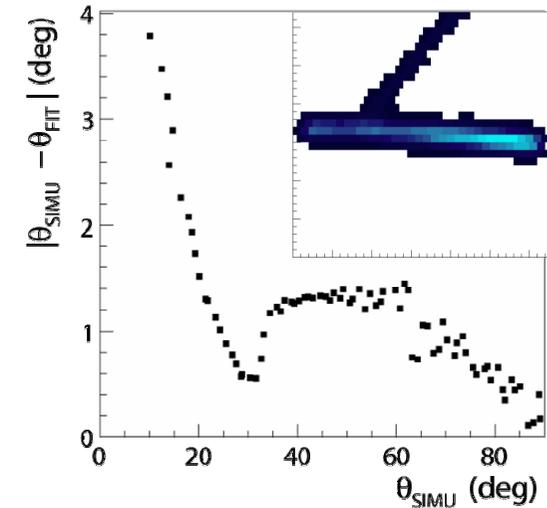

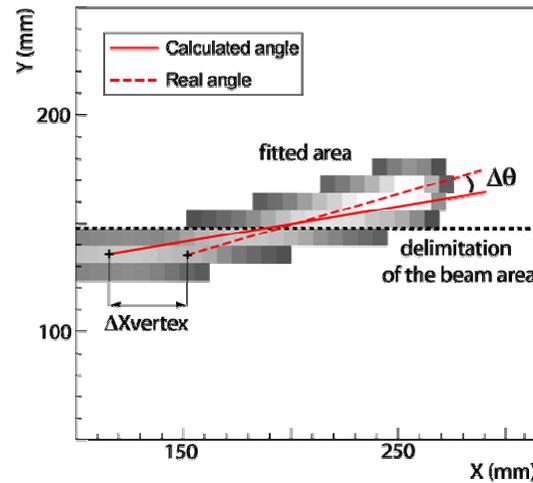

One track

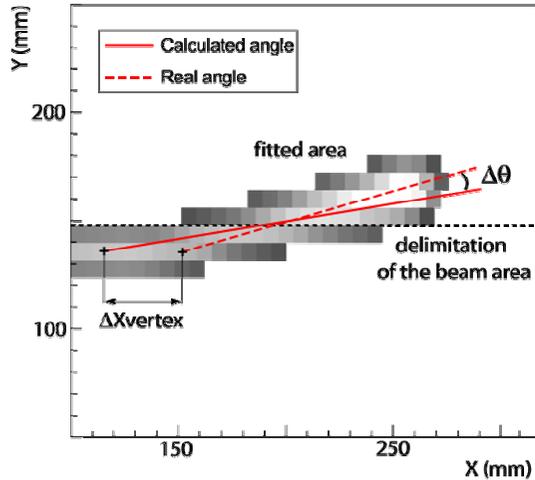

Resolution reaches 0.5°  
 Range > thickness (3 PADS)

Multiple tracks

Resolution > 1°  
 PAD size could help... (image processing)

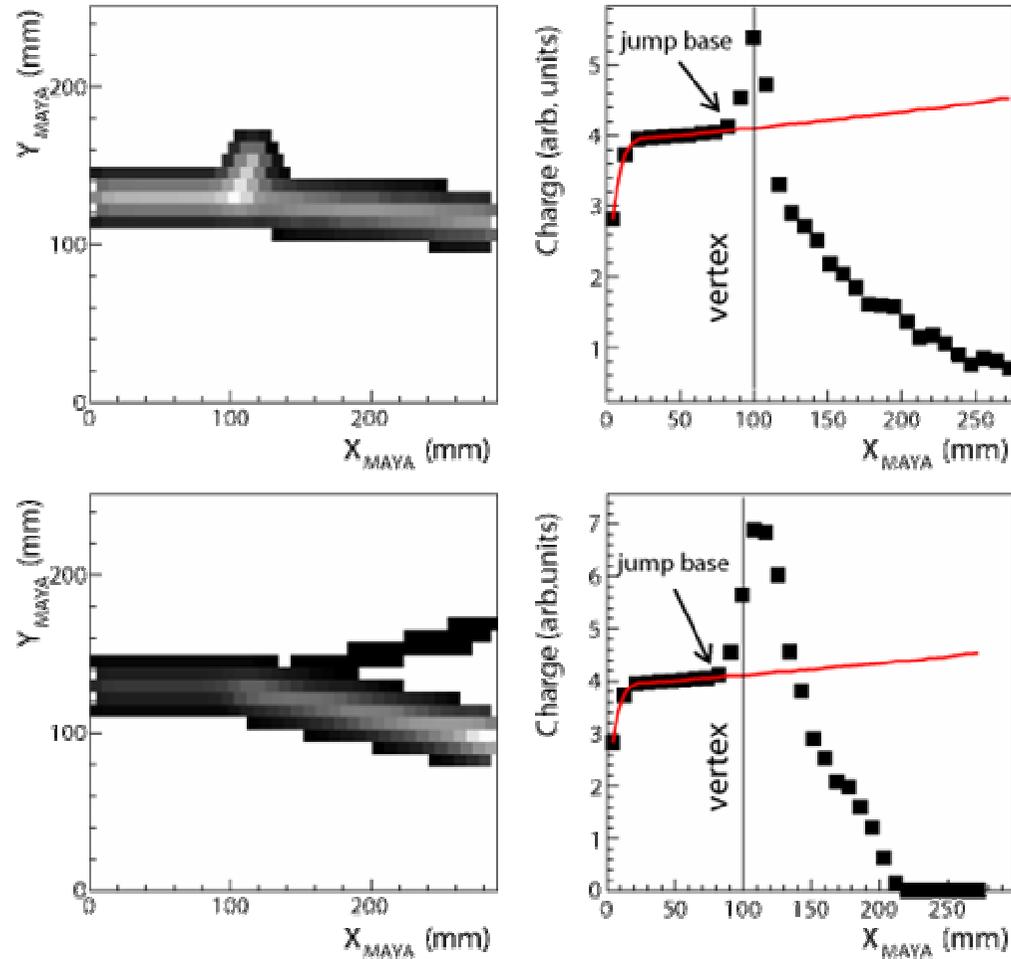

Intersection point method

angles  $> 30^\circ$   
 $\rightarrow$  Resolution  $< 2$  mm

Small angles  
 $\rightarrow$  Resolution  $> 8$  mm

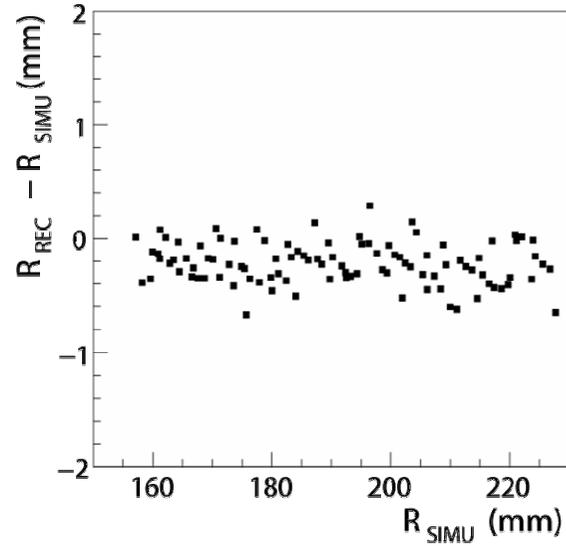

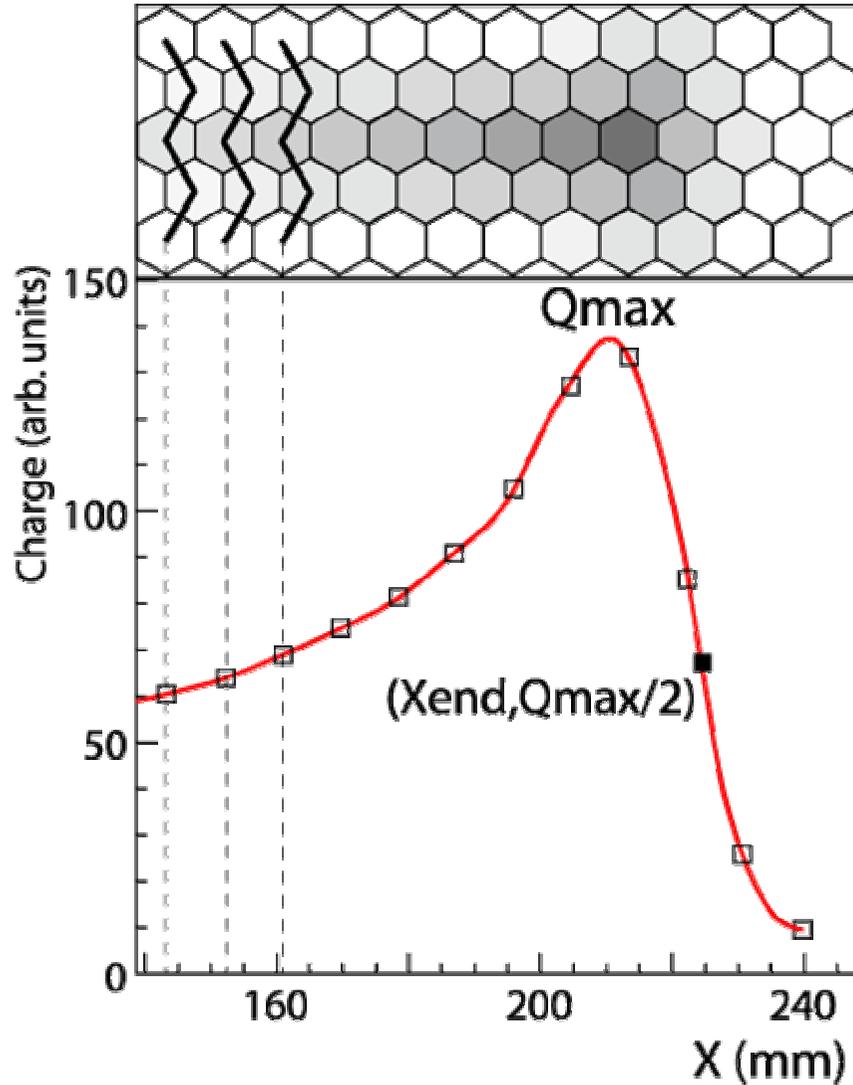

Charge profile method

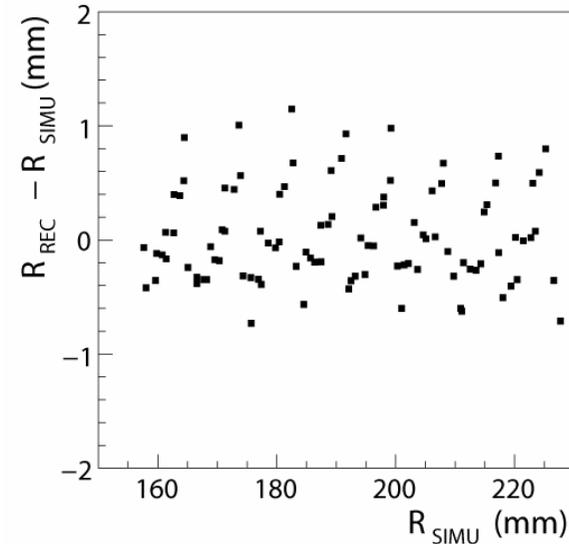

Resolution : 1 PAD

Better if good charge resolution

## Range measurements : Ending point

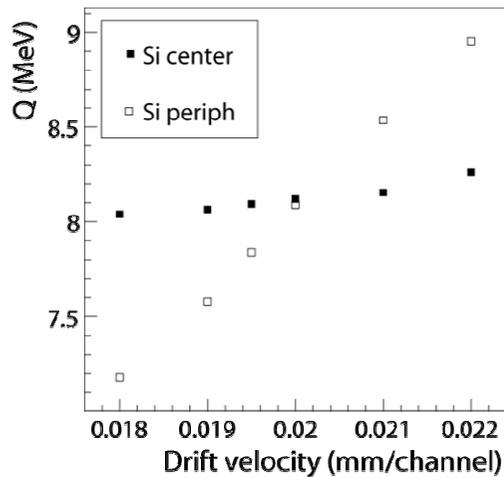

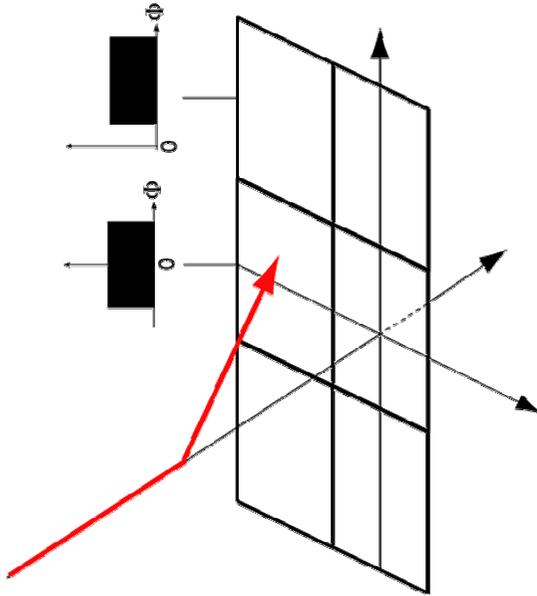

No threshold :  
 Resolution < 0.5 mm

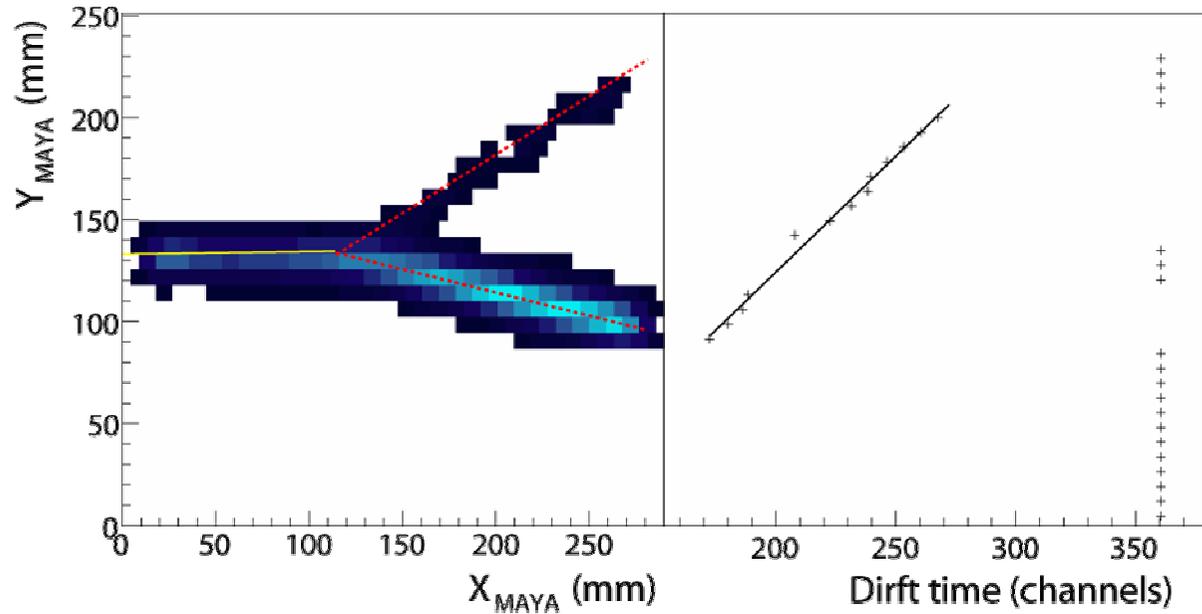

10% threshold :  
 Resolution > 1.5 mm  
 + digitalization!!

Lower threshold  
 needed!!!

Drift velocity calibration  
 → using physics!

Reaction plane angle

Resolution  $> 3^\circ$

Requires at least 2 wires

→ Limitation :  $|\Phi| < 60^\circ$

Solutions :

- more wires
- time signal from pads

Observable	Resolution	Difficulties	Solutions...
$\Delta E_{PAD}$	> 1 au	Dynamics No absolute calibration	Better charge resolution Increase dynamics
$\theta_{2D}$	~ 1°	Thickness of the track Range of particles	Smaller pad size Increase dynamics
$\phi$	> 3°	Number of wires/points	More wires – time signal on pads
Range	~ 1.5 mm	Influence of the threshold	Lower threshold
